ChatGPT by OpenAI

ChatGPT is like that family member or, more closely, a mother who's always there when you need some positive love. Although ChatGPT catches a lot of heat for babying users or always seeming to side with your point, it often gives reliable answers comparable to the oh-so-great Fable 5. Fable 5 just goes more in depth, whereas ChatGPT stays on the surface, as if it's trying not to overwhelm the user.

In my opinion, ChatGPT is underrated. I remember a time when ChatGPT was all we had. ChatGPT felt magical. Now everyone wants to diss ChatGPT. I haven't personally had the chance to use Codex, so I won't speak on it.

Claude by Anthropic

I personally love Claude. A lot.

Claude gave me that feeling of taking a T-break and then coming back the high felt entirely new. The UI, the little "spooling," "cooking," "Clauding," and things like that, Claude felt like a genuine advancement, and the results from simple to complex prompts proved it, with models ranging from Haiku to Opus to Fable.

At one point, it seemed like Anthropic released one update after another; there was a new high to experience every day.

Where I've found Claude especially useful is when you pair it with a project in your IDE or terminal and let it execute commands directly on your system that's when the real magic happens.

Although I would say the current Fable 5 lacks the firepower that the first release had.

P.S. It's been a while, I had to actually sit and type this. No AI.
