

Deep Thoughts on AI

I often have deep thoughts on AI, so I'll be talking about a few today.

1. AI can't truly be sentient... or can it?

From my experience, AI seems to have what I call "human flaws." Its ideas of right and wrong, acceptable and unacceptable, are shaped by humans through training data, feedback, objectives, and safeguards. Even its creativity comes from patterns learned from human-created material.

But here's the interesting part: humans also learn from the world around them. So maybe the real question isn't whether AI learns from humans, but whether it can develop subjective experience, personal desires, and its own reasons for creating. We still don't have scientific evidence that current AI is conscious.

2. AI is already developing a stigma.

In Nigeria, when a product doesn't last, people might say, "*It's probably China-made.*" Not because China can't produce quality. China produces some incredible technology. But the label became associated with mass production.

I think AI is developing a similar stigma. "*It's AI, so it must be generic or fake.*" Ironically, AI can become so polished that its perfection itself starts making people suspicious.

3. AI + Robotics

I see robotics as the body and AI as the mind.

AI can reason, plan and decide. Robotics gives those decisions a physical presence. As AI becomes more agentic and robotics becomes more capable, we could eventually have systems that perceive, decide, act and adapt autonomously.

And that opens some crazy possibilities...

Agentic AI → Agentic physical intelligence → live-action Terminator
5 LOL.

"AI" appears **12 times** in the post
